6G4Z2101: Introduction to Web Design and Development

CSS3

transforms, transitions and animations

CSS3

- CSS3 is the newest specification for CSS
- CSS is divided into “modules” – some are old specifications, some are new
- W3C bring different modules to the Recommendation level at different times
 - 7-stage process
 - W3C receives a Submission
 - W3C publishes a Note
 - W3C creates a Working Group
 - W3C publishes a Working Draft
 - W3C publishes a Candidate Recommendation
 - W3C publishes a Proposed Recommendation
 - W3C publishes a Recommendation

CSS3 modules

- CSS3 is split into modules, such as
 - Selectors
 - Box model
 - Backgrounds
 - Colours
 - Text effects
 - 2D/3D transformations
 - Animations
 - Multiple column layout
 - and more

CSS3 box styling features

- **border-radius:** create rounded corners for borders

```
border: 2px solid #a1a1a1;  
padding: 10px 40px;  
background: #dddddd;  
width: 300px;  
border-radius: 25px;
```

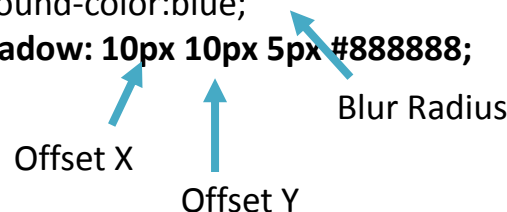

The border-radius property allows you to add rounded corners to elements.

The border-radius property allows you to add rounded corners to elements.

- **box-shadow:** add shadow to boxes

```
width:300px;  
height:100px;  
background-color:blue;  
box-shadow: 10px 10px 5px #888888;
```

Offset X Offset Y Blur Radius

- [Mozilla Developer pages](#)
- [w3schools try it out](#)

Text effects

- text-shadow:
 - Specify horizontal value, vertical value, blur distance value and the shadow's colour

```
h1 {text-shadow: 5px 5px 5px #FF0000; }
```

- Also 'overflow' and 'word-wrap' controls
- More effects possible with transitions, transforms and animations
- Further reading
 - [Mozilla Foundation](#)
 - [w3schools](#)
 - [more examples](#)

Text-shadow effect

```
h1 {  
  text-decoration: underline overline;  
}
```

Underlined and Overlined Header

CSS3 Transforms

- 2D transforms allow elements to change shape, size and position eg you can **translate**, **rotate**, **scale**, **skew**
- Uses x-axis and y-axis values
- [3D transform](#) allows you to rotate an element around the x or y axis
- Read more
 - [w3schools](#)
 - [www.the-art-of-the-web](#)

box 1 - transform: translate;

box 2 - transform: rotateY;

box 3 - transform:
scale;

box 4 - transform: rotate;

6G4Z2101: Introduction to Web Design and Development

CSS Transitions

- Transitions allow you to animate properties such as width, height or background colour
- Transitions have a timing function, and a trigger (e.g. mouse hover)
- Set an **initial state** (e.g. a starting width)
- In the transition statement say **what properties** you want to transition
- In the **hover** statement you add the new property values

```
#divname {  
    width: 150px;  
    height: 200px;  
    background: #ffffff  
    transition: width, height, background;  
}
```

```
#divname: hover {  
    width: 300px;  
    height: 400px;  
    background: #666;  
}
```

Transition timings

- Transitions can have a duration over which they will run
- A delay can be added
- Timing functions include linear, ease-in, ease-out, ease-in-out
- Timings are useful for adding smoothness to a transition

[See examples](#)

```
#divname {  
  transition: width, height, background;  
  transition-duration: 3s;  
  transition-delay: 1s;  
}
```

Transform with Transition

- If you create a transform and want to add a timing function, you can add the transform to a transition

```
#divname {  
    transition: transform 3s;  
}
```

```
#divname:hover {  
    transform: translateY(6em) scale(1.2, 1.2) rotateY(180deg);  
}
```

Animating with keyframes

- CSS3 animation allows you to use keyframes to control the state of the animation at given points as the animation is running
- Keyframes are declared using a percentage value of the total animation duration
- Statements can include more than one animation effect

```
#divname {  
width:200px;  
height:200px;  
background:red;  
position: relative;  
animation: myAnim 5s;  
}
```

```
@keyframes myAnim  
{  
0% {background: red; left:0px; top:0px;}  
25% {background: yellow; left:400px; top:0px;}  
50% {background: blue; left:400px; top:400px;}  
75% {background: green; left:0px; top:400px;}  
100% {background: red; left:0px; top:0px;}  
}
```

See simple animation [example](#)

CSS Transitions & Animations

- Transitions (often with Transforms) & Animations allow you to create animation effects that can replace animated gifs, Flash animations and JavaScript

Examples

- [Page-flip book effect](#)
- [Animated menus](#)
- [cssplay.co.uk](#) has a wide variety of css3 examples, many with animation (referenced on w3c website)
- [Animation-transition examples](#)
- When looking for examples of css animations you will find that some also rely on using some Javascript

Text animation

- Text can be animated by using transitions and animations
- Allows Flash-type effects often used in advertising banners within web pages
 - Example of [rotating through a sequence](#) of words
- Examples of splash pages using css3
 - [splash-and-coming-soon-page-effects-with-css3/](#)

Browser prefixes

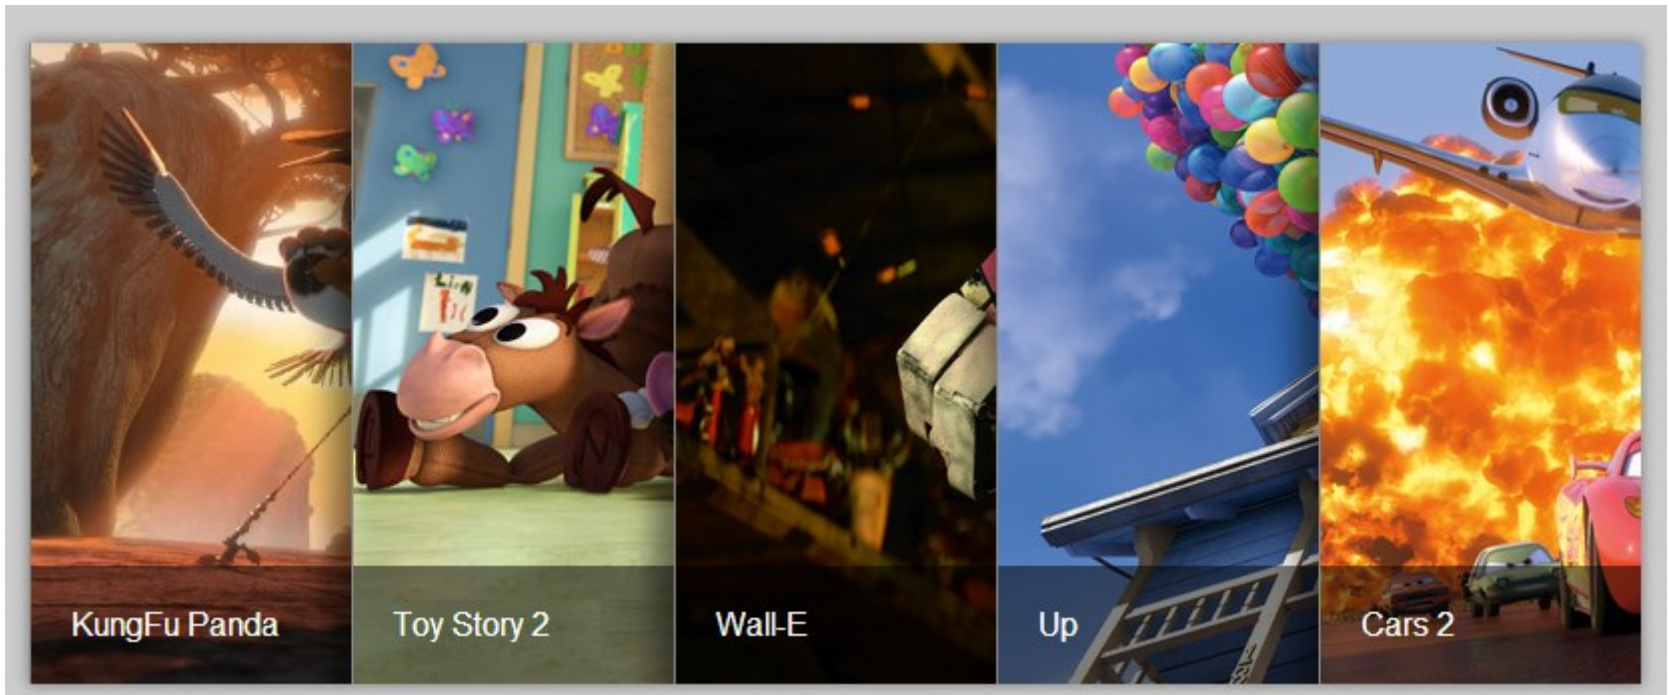

- Older browsers may not handle some CSS3 elements without the use of browser prefixes
 - -webkit- for Chrome and Safari
 - -moz- for Firefox
 - -ms- for IE
 - -o- for Opera
- Check browser support

http://www.w3schools.com/cssref/css3_browsersupport.asp

```
#divname {  
    -webkit-transform: background 5s;  
    -moz-transform: background 5s;  
    -ms-transform: background 5s;  
    -o-transform: background 5s;  
    transform: background 5s;  
}
```

CSS3 slider example

- Accordion-style slider using CSS3 from thecodeplayer.com

Multiple Columns

- A useful feature that allows you to lay text out in newspaper style columns easily, without the need for tables or floated divs
- **Column-count** property defines the number of columns (e.g. `-moz-column-count:3`)
- **Column-gap** property defines number of pixels between columns (e.g. `-moz-column-gap:40px`)
- **Column-rule** properties set the width, style and colour of the line between columns (e.g. `-moz-column-rule-style:dotted`)

Final note

- There is more to both HTML5 and CSS3 than we have covered
- The specifications, especially CSS, are still evolving, and will continue to do so
- Remember to use browser prefixes where necessary
